The APL+Win v13.2 release is available and recommended for all
current APL+Win subscribers. To download this release, visit
http://www.apl2000.com/software.php and click the file
"APL+Win v13.2 Update" using your software download username
and password. For a new installation, click the file
"APL+Win v13.2 installer".

The APL+Win 13.2 includes the following enhancements/bug fixes:

1. New ⎕CSE (C# Script Engine): ⎕CSE allows an APL+Win application
system programmer to use the C# programming language to access the
Microsoft .Net Framework and obtain the benefit of the Framework tools.
For the complete details on ⎕CSE, refer to the PDF file
"APL+Win C# Script Engine Manual.pdf" in the DOCS folder.

2. Bug Fix [Interpreter]: In APL+Win 13.1, using the optimized catenation
syntax to catenate a singleton nested value into an empty nested array
corrupted the workspace and crashed APL+Win.

3. Bug Fix [APLGUI]: In APL+Win 13.1, the items in the list property of a
style 4096 (Indents and images enabled) Combo control didn't appear in
the drop-down list.

4. Bug Fix [APLGUI]: In APL+Win 13.1 and earlier, when visual styles were
enabled either internally or externally via the manifest file, the following
visual anomolies were observed:

  1. In Windows XP, the Option control displayed with a black background
     color when it was a child of a Frame control with styles 0, 1, 2 and 3;

  2. In Windows 7, the Check control displayed with a black background
     color when it was a child of a Frame control with styles 1, 2 and 3.

5. Bug Fix [APLGUI]: In APL+Win 13.1, the style 6 Frame control didn't display
a white colored background with "[Config]CTL3D=0" in the APLW.INI file.

Note: Workspaces saved in v13.1 and newer will not load in prior
versions of APL+Win.
